CommScope Wi-Fi/wired networking solutions serving multi-dwelling unit property owners

Overview
Apartments, mixed-use complexes and other multi-dwelling units (MDUs) pose unique challenges for service providers offering wired and wireless networking given their shared infrastructure, common areas and private residences within them. Both residents and owners of MDU properties consider Wi-Fi and wired broadband connections, at no less than 10 Mbps to 50 Mbps per device, must-have amenities—as important as traditional utilities.

The challenge: providing a turnkey MDU networking service for a leading service provider solution
When a major service provider needed a comprehensive solution for MDU property owners, it came to CommScope for a turnkey system that could deliver high-performance bulk connectivity under the service provider’s brand. The solution had to be capable of covering any mix of living units, common areas and shared spaces, no matter the property size and configuration.

The CommScope solution: a comprehensive, ready-to-deploy suite of products and services
To give the service provider a highly competitive solution ready for tenants on day one of occupancy, CommScope delivered a comprehensive, ready-to-go suite of products and services. The solution included onsite hardware that could be quickly deployed, along with tier 1 support for individual tenants and proactive NOC support with critical notifications to property owners.

The CommScope advantage: an unmatched ability to problem solve and simplify
Few others were equipped to match the pricing, scope, services and technology that CommScope was able to provide. Our Ruckus access points are best in class, and the shared SSID approach eliminates the large airtime overhead typical of other dense wireless environments.

For this service provider, CommScope bundled all the required hardware, software and service components into one coordinated package. This meant the service provider could focus on selling its service to the property while we managed deployment and provisioning and provided support for the new solution.

The CommScope solution includes:
- Surveying each property and creating a quote
- Designing, installing, testing and turning up the new services
- Hosting back office tasks at a CommScope data center, including monitoring and proactive management, with a 99.9% uptime guarantee

Benefits for service providers
- Comprehensive turnkey MDU system
- High performance Internet access everywhere
- White label solution
- CommScope data center hosting and support

For more information, visit commscope.com
• Customizing portals to support the service provider's brand
• Delivering performance in uptime, call handle time and mean time to repair that sets the service provider apart from other networking options

The result: Residents get rich connectivity right away, while the service provider gets a competitive advantage and a stronger brand

By combining survey, design, equipment, testing and managed services in one comprehensive solution, CommScope allowed the service provider to instantly offer a world-class connectivity package to MDU property owners, regardless of property configuration and size. Going forward, the service provider can custom-match capabilities to any MDU’s needs so residents get the network performance and connectivity options they expect. Tenants do not have to configure equipment setup, but can easily access files on their computers, communicate with printers and manage their streaming media devices and smart home appliances in a way that feels like having a personal residential router.
